Info **Hensel specialist consultant on-site at www.hensel-electric.de**

Standard-conforming rating of distribution boards intended to be operated by ordinary persons (DBO) according to IEC 61439-3

The new EN 61439 - the standard for the construction of switchgear assemblies - brings changes that affect the planning of a switchgear assembly. In addition, new tasks and responsibilities are awaiting the manufacturer of a switchgear assembly.

Decisive for the optimal functioning of a switchgear assembly under operating conditions is the correct rating of the interface characteristics of the assembly. For this purpose, the assembly is considered as **BLACK-BOX** with four interface characteristics which shall ensure compatibility with the ratings of the circuits to which it is connected and the installation conditions and shall be declared by the assembly manufacturer using the criteria identified below.

Assembly considered as BLACK BOX with the four interface characteristics according to IEC 61439-3

Installation and ambient conditions

- For protected outdoor installation
- Degree of protection IP 66
- Combinable enclosure system, extendable in all directions
- 4 enclosure sizes in grid of 90 mm
- EMC complient busbar system
- Wall-mounting

Operation and maintainance

- Distribution board up to 250 A
- Protection class II up to rated current of 250 A
- Flexible through standardised and tested kits
- Spacious connection areas
- Fulfill the requirements for operation by ordinary persons (DBO)

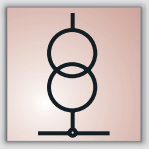
BLACK BOX
with 4 interfaces

ENYSTAR Distribution Board

Combinable enclosure system, insulation-enclosed, total insulated, degree of protection IP 66,
for the assembly of ENYSTAR distribution boards up to 250 A intended to be operated by ordinary persons (DBO) in accordance with IEC 61439-3

The requirements for all installed electrical functions within the assembly have been proved compliance with the applicable requirements of IEC 61439-3.

I_{nc} and RDF must be specified in the documentation.



Connection to the electrical network

- Electric circuit / final circuit
- Circuit-breaker up to 250 A
- Switch disconnector up to 250 A
- Fuse switch disconnector up to 250 A
- Bus-mounted fuse base up to 63 A
- Cable connection from top / from bottom
- Connection: conductors from copper / aluminum
- Optional connection of CEE sockets according to EN 60309 and sockets with earthing contact according to DIN 49440-1

Circuits and consumers

- Rated voltage U_N = 690 V a.c. / 1000 V d.c.
- Rated current I_N up to 250 A
- Circuit-breaker up to 250 A
- Switch disconnector up to 250 A
- Fuse switch disconnector up to 250 A
- 5-conductor systems
- Cable connection from top / from bottom

Requirements for distribution boards intended to be operated by ordinary persons (DBO) according to IEC 61439-3

General requirements concerning distribution boards

1. **Clear separation between operation area and distribution area**
   For areas in distribution boards to which unskilled persons have access, standards require special protective measures:
   - Life parts are to be protected against accidental contact by a cover.
   - Devices, which may be operated only by an electrical skilled person, are to be arranged in a separate area, which is to be opened only with tool.
2. **Fast and safe operating of the intended devices, e.g. series built-in equipment and switching devices**

Additional specific requirements when used in commercial and industrial applications:

1. **High degree of protection IP 66:** dust-proof and waterproof
2. **Robust material for use in rough environments:** high-quality thermoplastic material for high mechanical loads.
3. **Corrosion resistance:** Material resistant to corrosion by atmospheric humidity or industrial processes.

Operation also by electrotechnical unskilled persons

- Operating areas for **unskilled persons** can be reached quickly and easily via door locking with hand operation

Requirements in accordance with IEC 61439-3:

1. Only installation equipment, like series built-in equipment, fuses up to 63 A, circuit-breakers and IT-components are permitted. For the access a tool-operated door locking facility is **NOT** necessary.
2. Other switching devices must be installed behind separate lids or doors, which can only be opened using a tool: **protection against direct contact with hazardous live parts IP XXC**.

Access and operation only by electrical skilled persons

- Devices which must only be operated by **skilled persons**, must be installed in a separate area which can only be opened using a tool

To the following areas **only an electrical skilled person** may have access:

- feeding-in
- back-up fuse
- outgoing terminals.

Therefore access is possible **only with appropriate tools.** The access can be prevented by optionally lockable doors. Electrotechnical unskilled persons have no access here.

ENYSTAR
Recommendation for outdoor installations, humid and wet areas and locations

Country-specific requirements have to be observed!

Requirements of German standard DIN VDE 0100 Part 737 for compliance with IP degree of protection

1. Requirement
Protection against ingress of water for all electrical equipment (devices) with the appropriate encapsulation (2nd characteristic numeral)

1.1. Minimum requirement for electrical equipment:

Note for outdoor installation:

„Protected outdoors“
Electrical equipment has to be protected from precipitation (like rain, snow or hail) as well as from direct sunlight.

„Non-protected outdoors“
Electrical equipment can be exposed to precipitation or direct sunlight.
With both assembly sites the climatic effects on the installed equipment must be observed, for example, high or low ambient temperatures or condensation.

1.2. Minimum requirements for electrical equipment, that must withstand higher environmental stresses:

degree of protection IP X 4

with **non-direct** jets of water within occasional cleaning procedures, e.g. agriculture

degree of protection IP X 5

with **non-direct** jets of water within operational cleaning procedures, e.g. carwash

degree of protection IP X 5 and additional consultation with the manufacturer:

with **direct** jets of water within occasional cleaning procedures of enclosures, e.g. butcher's shop

Country-specific requirements have to be observed!

2. Requirement of German Standard DIN VDE 0100 Part 737

4.1 Electrical equipment must be selected taking into account the external influences to which they may be exposed. Proper operation and the effectiveness of the required degrees of protection must be assured.

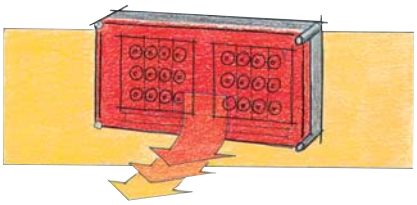
Note: Data from the manufacturer!

Formation of condensed water

How does condensed water occur in enclosures with a high degree of protection?

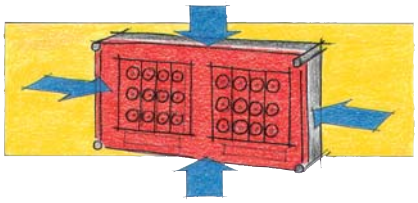
Condensed water only forms in enclosures with a higher degree of protection than IP 54 due to temperature difference from inside to outside. Humidity can not evaporate because of the high degree of protection of the enclosure.

System switched on.



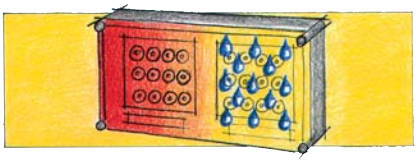
The internal temperature is higher than the external temperature due to the power dissipation of the built-in devices.

System switched on.



The warm air inside the enclosure attempts to accumulate moisture. This comes from outside through the seal as the enclosures are not gas-tight.

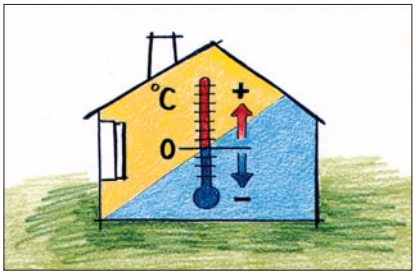
System switched off.



The internal temperature is reduced by cooling down the system e.g. by switching off the loads. The cooler air emits moisture which is collected as condensed water on the cooling inner surfaces.

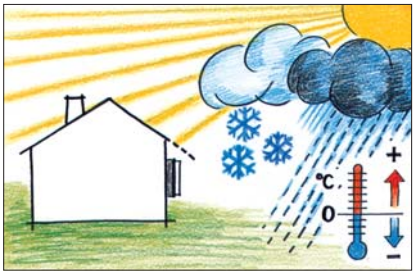
How does condensed water occur in enclosures with a high degree of protection?

Formation of condensed water for **indoor installations:**



In areas where high levels of air humidity and large temperature fluctuations are expected e.g. in laundry rooms, kitchens, car washes etc.

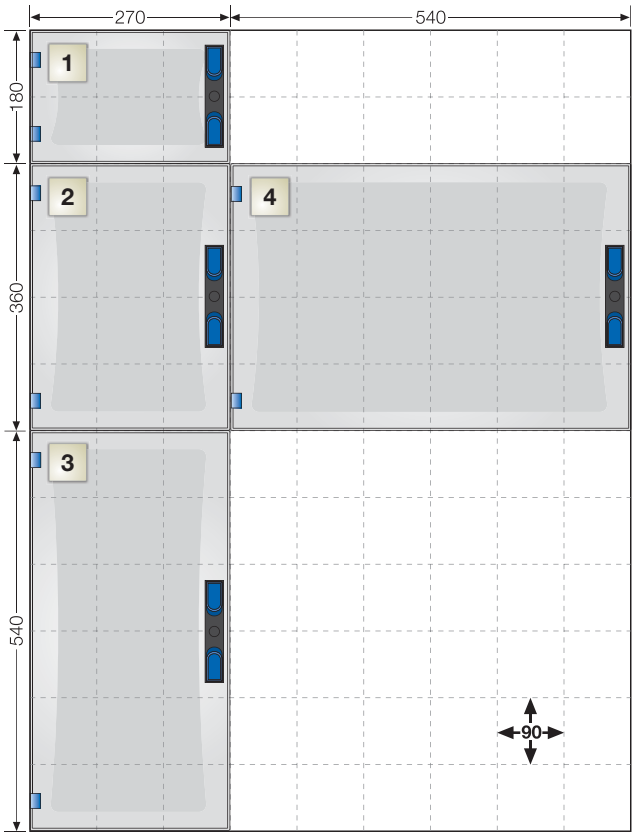
Formation of condensed water in **protected outdoor installations** (protected against weather influences) **or unprotected outdoor** installations:



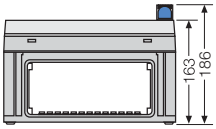
Here condensed water can be formed dependent on the weather, high air humidity, direct sunlight and temperature differences compared to the wall.

The modular structure of enclosures in grid of 90 mm allows a free configuration of the outer form.
Combinable in all directions to follow given requirements on site.

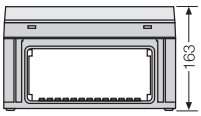
Different enclosure depths allow the installation of equipment of different heights.
With an extension frame the depth of the enclosure sizes 3 and 4 can be extended by 50 mm.



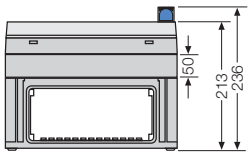
Enclosure depth
with hand operation



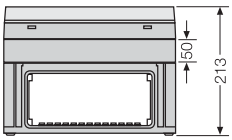
with tool operation



Extension frame
for extending installation depths by 50 mm with hand operation



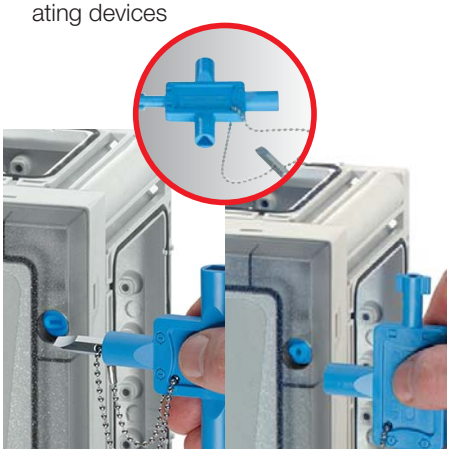
with tool operation



Operation
Clear separation of the operation areas for unskilled persons and access/operation areas for skilled persons (electricians).

- Hand operated doors in areas to which unskilled persons have access for operating devices

- Locking facilities with keys prevent the unauthorized opening of doors



- Standard tool operation for slotted screwdrivers and triangle (option square, double bit)

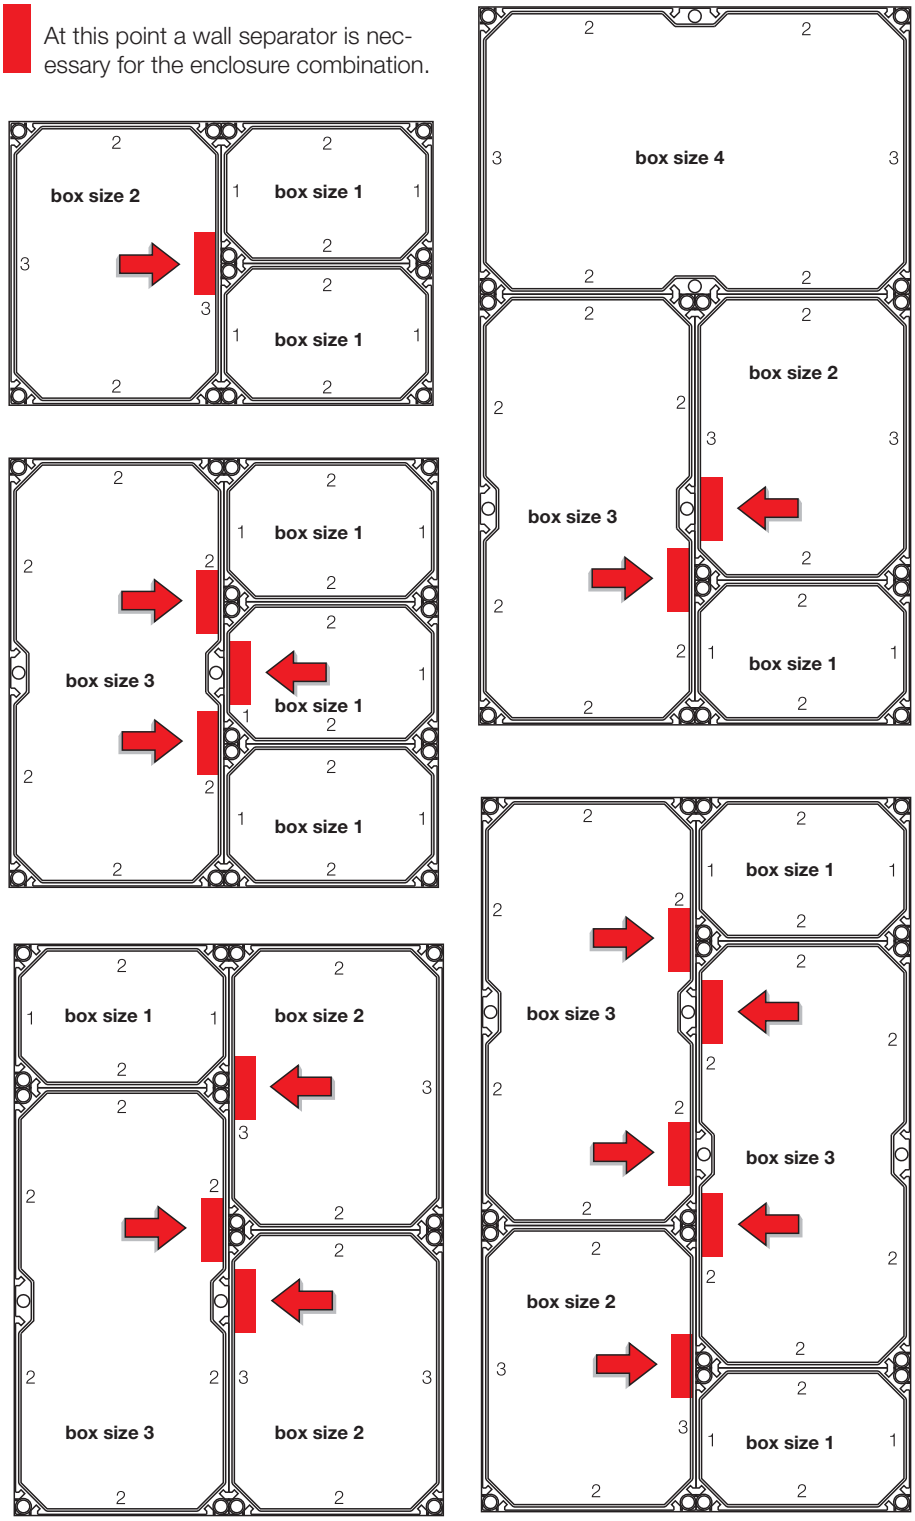
Positioning of enclosures
Assembly of enclosures according to layout

Removal of the frames with door

Unscrew and remove the frame from the bottom part together with the door.

Combination of enclosures with connectors and wall separators

At this point a wall separator is necessary for the enclosure combination.



Fast assembly and mounting

All necessary gaskets are integral part of the enclosures. The enclosures are interconnected among themselves by easily pushing-in of connectors. No tools are necessary.

Connectors are attached to the enclosures in sufficient number. For reconstruction or extensions of existing distribution boards connectors FP GV 10 (set consists of 10 pieces) can be supplemented.

The connection of enclosures is not only co-ordinated with enclosures of the same size.
By means of wall separators also different sized enclosures can be combined.

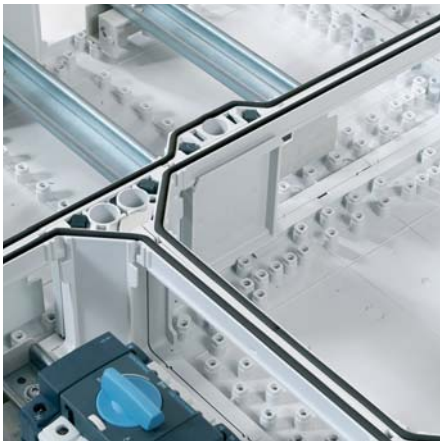
Wall separators provide for high rigidity and tightness at the connection points of the enclosures, degree of protection IP 66.

Connection of enclosures

Assemble enclosues by push-ing-in enclosed connectors.

Inserting wall separators

Use wall separators to connect different sized enclosure walls.



Closing walls via closing plates

Insert closing plates into openings of outer walls of the distribution board and fix them with enclosure connectors.

Cable entry - opening knockouts in flanges

Knock out the appropriate cable entries within flanges with screwdriver.

Cable glands

Insert cable gland into the appropriate knockout and fasten with lock nut.

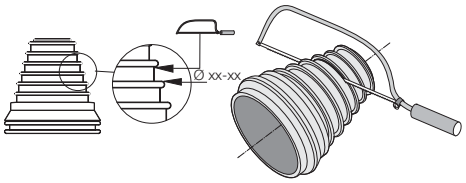
Closing of enclosure walls with flanges for cable entry

Insert flanges for cable entry into open outer walls of the distribution board and fix them with enclosure connectors.

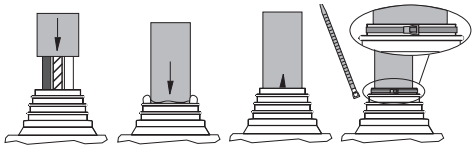
A wide range of flanges for the cable entry is available.

Installation of cable inserts
Saw the box fin.
Afterwards the cable insert is mounted and fixed via enclosure connectors and the rubber entries can be inserted.

Adjust stepped grommet on the cable diameter.



Insert cable and fix it with the cable ties.



Insert the cable into the box from the front.

Box fin
provides an easier wiring across two boxes.

Saw out fin in box wall.

Insert box fin and fix via fixing wedges.

Installation of extension frame
Fix attachments for extension frame in base of enclosure. Place extension frame on base of enclosure and screw it.

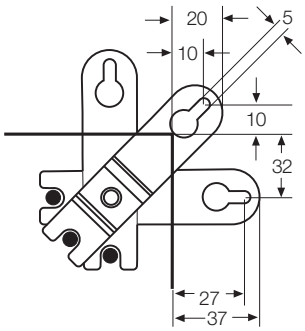
Support for protection cover is adjustable in height.

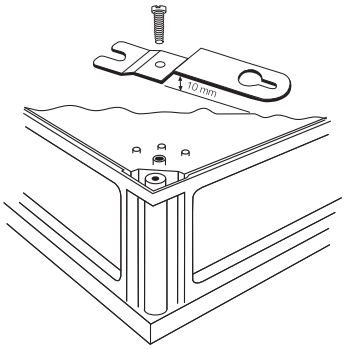
Click protection cover into place depending on the height of the electric devices (height adjustable).

FP ZR ..
Extension frame
for extension of the installation depth by 50 mm

External brackets made from stainless steel
for external box fixing

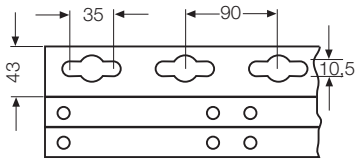
FP AL 40 (4 pieces)

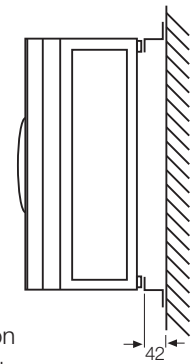




Mounting profile
for wall-mounting of ENYSTAR distribution boards, steel profile,
length 1980 mm
FP MS 1

Fixing matrix of mounting profile





Note:
Please fix mounting profile in vertical position as possible in order to give occation to cable routing behind the assembly.

For cutting to the required length fix mounting profile for example with a clamp to a desk.

Transport
Regarding transportation it is recommendable to protect the assembly against deflection. For that please screw the assembly to a solid timber.

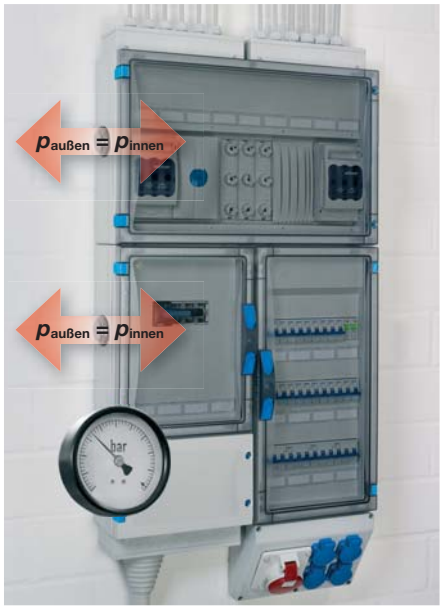
Ventilation flange
FP BF 36
for ventilation of ENYSTAR distribution boards in the event of extremely high internal temperatures or a risk of water condensation.
For vertical installation on box walls, degree of protection IP 44

FP BF 36

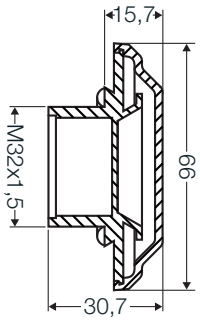
FP BF 36

Pressure compensation element BM 32
for the reduction of condensation by pressure compensation in power distribution systems

BM 32



BM 32



Combi climate glands KBM / KBS ...
for reduction of condensation by pressure compensation

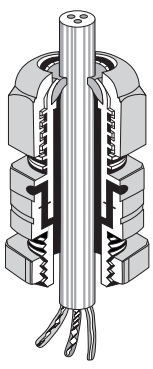
Via an inserted climate membrane they ensure pressure compensation between enclosure interior and ambient air.

Ingress of water through the calbe gland is prevented.

The degree of protection of the enclosure is obtained!

KBM ...

KBS ...



Canopy for the unprotected installation outdoors

Mount the flange with pre-assembled canopy on upper housing wall.

In case of box assembly connect trusses with stop plate.

Mount canopy and/or canopy end plate

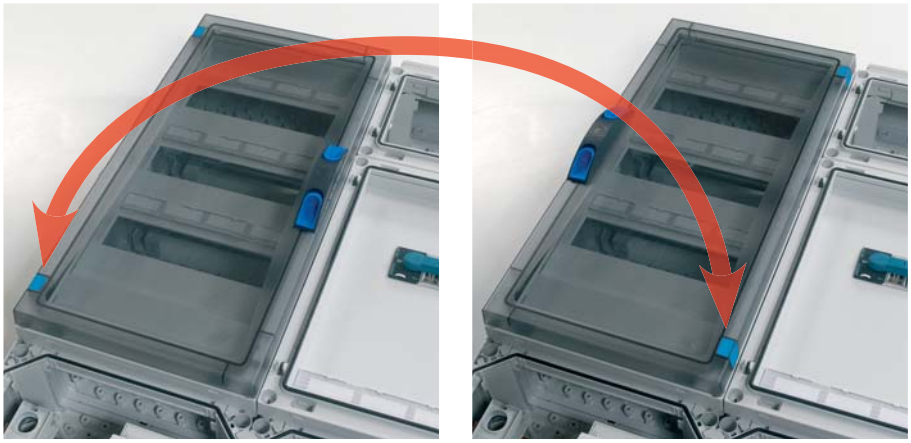
Hint:
Insert canopy end plate under the canopy until it hits back-stop.

FP DB 27

FP DB 36

Mi DB 01

Changing door hinges



Remove door hinge from the door frame.
Then remove interlocking device for the door lock from the frame.

Insert interlocking device and door hinge on the other side in the frame.

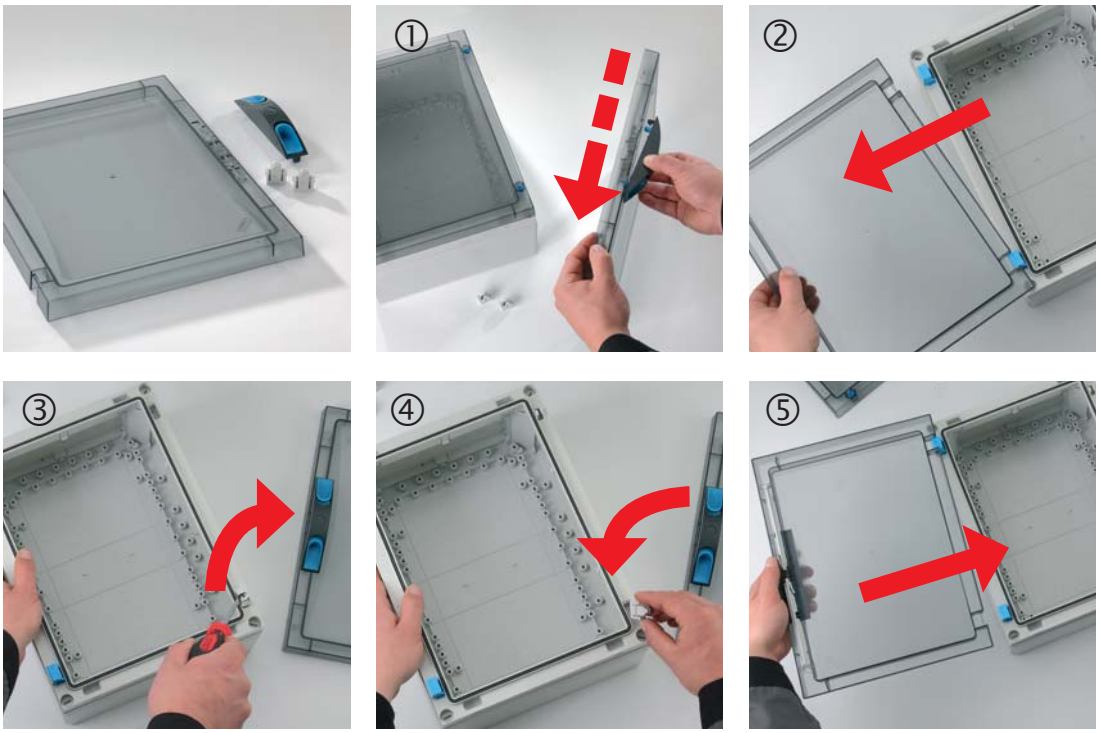
Hint:
When changing the door stop in circuit-breaker boxes the protection cover must be turned around.

18

ENYSTAR
Installation
Convertion of door locks

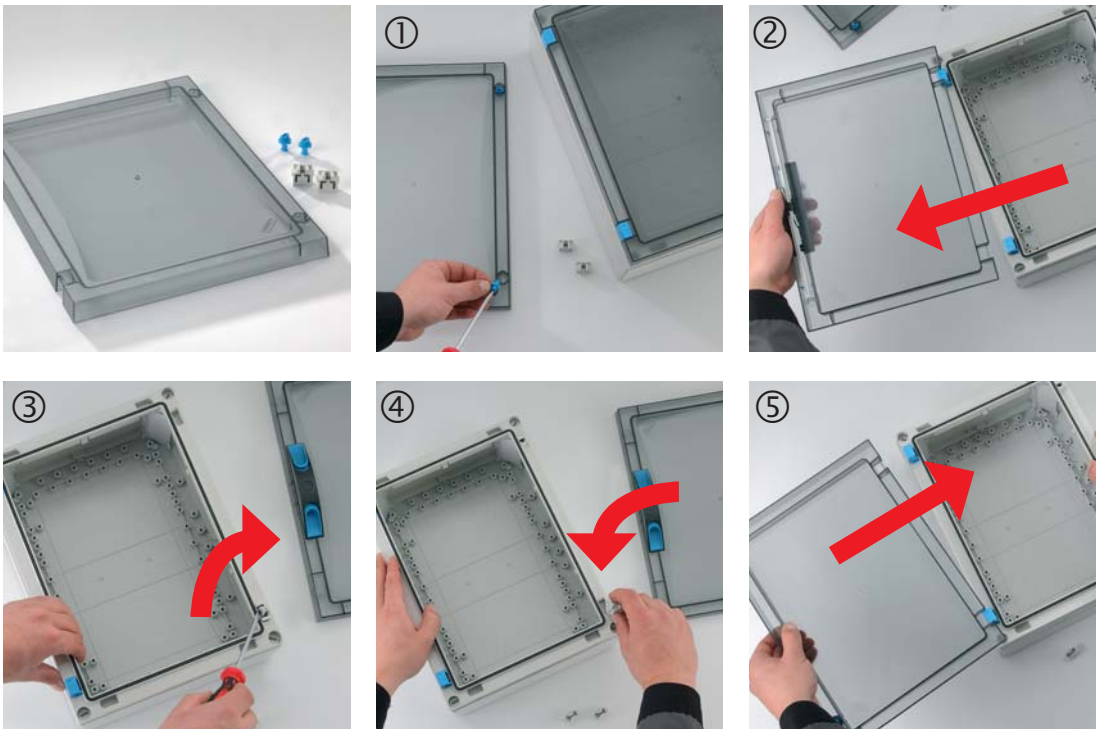
Convertion of tool-operated to hand-operated door locks

1. Insert hand-operated door lock onto the door
2. Drag the door from the hinges
3. Remove interlockings from the frame
4. Insert the new interlockings
5. Snap door back into door hinge



Convertion of hand-operated to tool-operated door locks

1. Insert tool-operated door lock onto the door
2. Drag the door from the hinges
4. Insert the new interlockings
5. Snap door back into door hinge



Device installation on mounting plates or DIN rails

Fasten installation devices on mounting plates with self-threading screws.

Screw mounting plate onto base of box.

Mount DIN rails direktly onto base of boxes or on spacers FP DS 02 in heights of 29.5 mm or 53.5 mm.

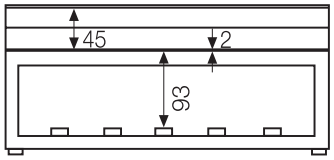
FP DS 02

Device installation into covers

Pre-drill the cut-outs at the corners and saw them out of the cover.

Use a piercing saw with coarse toothed saw blade for plastics. Install device.

Snap cover into door frame from the rear.
Afterwards, screw door-frame with door and cover onto base of enclosure.



Installation depth for equipment installation in covers

Sealing

For installation in all enclosures except circuit breaker boxes.

Sealing device is screwed on enclosure bottom.

Open pre-moulded opening for sealing device (drill Ø 5 mm) and screw the cover with frame.

Then screw the frame with door and cover onto base of enclosure.
Seal the cover.

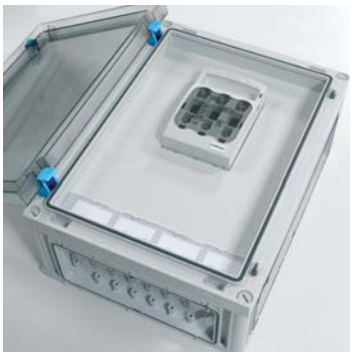
Changing direction of cable connection
HRC fuse switch disconnector HRC 00C and HRC 1

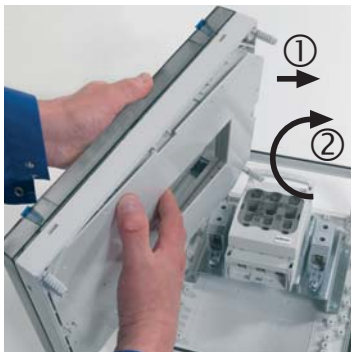
Remove cover from frame ① and and rotate cover ②

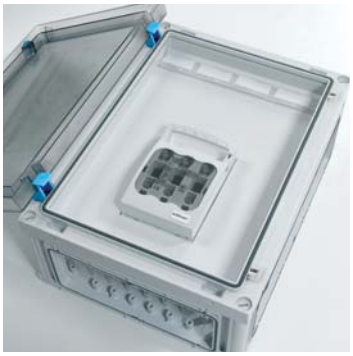
Snap cover back into the frame ③.

Unscrew device support.

Replace device and screw on again.







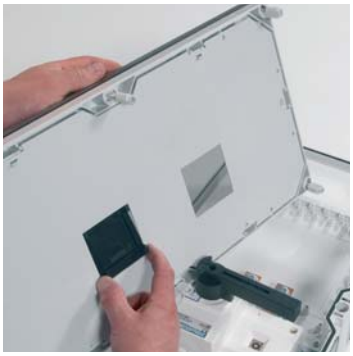
Changing direction of cable connection
Isolator box and circuit breaker box

Unscrew device support.

Replace device and screw on again.

Remove blanking strip from the cover.

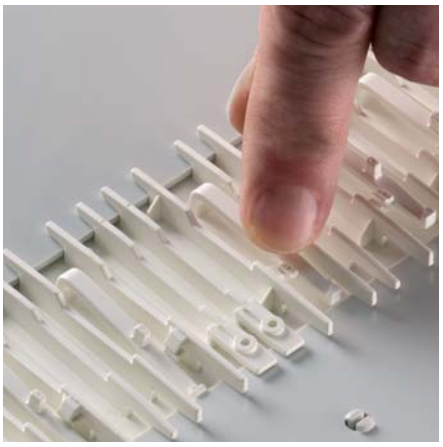
Replace blanking strip in the new position within cover.



Sealing of unused DIN rail openings in enclosures for DIN rail equipment with attached blanking strip

Cover unused equipment openings with blanking strips to prevent accidental contact.

Locking of the cover with enclosures with miniature circuit breaker (MCB).



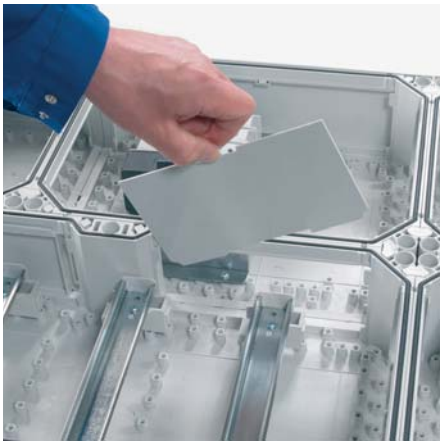
Covers

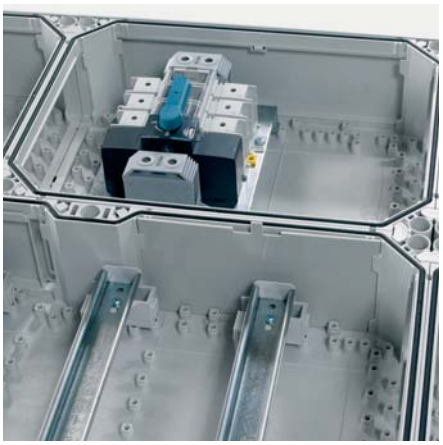
Cover unused openings and terminals for direct busbar connection with blanking cover FP BA 70.

FP BA 70

Partition

for insertion between enclosures allowing a protection against accidental contact between two installation areas.





Partition

not suitable with wall separator.

All terminals are secured against self loosening.

Connnection of aluminum conductors

I. Chemical basics

The special conducting characteristics of aluminum can be seen in the fact that the surface of an aluminum conductor is immediately covered in a **non-conducting oxide layer** upon exposure to oxygen.

This characteristic leads to an increase in the temporary resistance between the aluminum conductors and the terminal body.

This can lead to terminal overheating and in the worst case fire.

Despite these special conditions, aluminum conductors can be connected if the terminal used is appropriate and the following conditions are taken into consideration when connecting.

II. Special terminal requirements for the connection of aluminum conductors

The suitability of terminal for connections with aluminum conductors needs to be evaluated and confirmed by the terminal manufacturer.

1. These terminals will thus meet the requirements for an aligned **electrochemical voltage sequence**. A disintegration of the base material (aluminum) will be prevented.
2. The terminal has an appropriate shape and surface to penetrate the grease layer or a very thin oxide layer on the aluminum conductor upon connection.

III. Appropriate preparation and handling of aluminum conductors

The non-insulated conductor ends need to have the oxide layer carefully scraped clean using a knife for example. In doing so no files, sand paper or brushes may be used.

Immediately after removing the oxide layer, the conductor end needs to be rubbed with an acid and alkali free grease such as technical vaseline and then immediately connected to the terminal. This in turn prevents oxygen from forming a non-conducting oxide layer.

Due to the flow tendency in aluminum the terminals need to be tightened before start up and after the first **200 operating hours** (note the appropriate torque).

The steps listed above need to be repeated if the conductor is removed and re-connected. I.e. the conductor has to be scraped again, greased and immediately connected, because it will be connected at a different position.

Routine test report in accordance with EN 61439-1

Serial No.	Type of testing*	Content of routine test	IEC 61439 Section	Result of routine test	Test engineer
1	S	Degree of protection of cabinets /enclosures (sealings, protection covers)	11.2	i. O.	
4	S	Incorporation of built-in components	11.5	i. O.	
7	P	Mechanical operation (actuating elements lockings)	11.8	i. O.	
2	S/P	Creepage and clearance distances	11.3	i. O.	
5	S/P	Internal electrical circuits and connections	11.6	i. O.	
6	S	Terminals for external conductors	11.7	i. O.	
8	P	Dielectric properties	11.9	>200 MΩ	
3	S/P	Protection against electric shock and integrity of protective circuits	11.4	i. O.	
9	P	Wiring, operational performance and function	11.10	i. O.	

The manufacturer must specify measures that must be implemented to maintain the designated degree of protection.

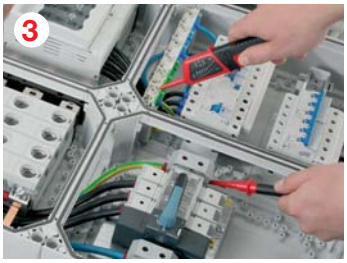
Check that seals and covers were installed according to the manufacturer's instructions.

The effectiveness of mechanical actuating elements, interlocks and locks including those associated with removable parts shall be checked.

The clearances between different potentials should be greater than the values in Table 1 of the standard. We recommend a minimum distance of 10 mm.

Conductors must be checked for consistency with circuit diagrams and bolted connections have to be checked at random.

Distribution boards intended to be operated by ordinary persons up to 250 A have to be tested at a voltage of 500 V d.c.
All distribution boards over 250 A a power-frequency withstand test shall be performed.



The protective circuits shall be subjected to a test for integrity of electrical connection.

The guide to design and assemble in accordance with EN 61439
for ENYSTAR distribution boards up to 250 A and Mi Power distribution boards up to 630 A can be downloaded:

www.hensel-electric.de/61439

CE marking

The laws for the safety of electrical equipment stipulate that a conformity assessment procedure has to be performed for assemblies as well. It is to prove that the assembly complies with the applicable regulations and conforms to the respectively valid safety standards.

Subsequently, a declaration of conformity must be created and the CE marking shall be affixed to the distributor.

Producing a new manufactured product from already existing manufactured goods, constitutes a manufacturer!
